

Product Description

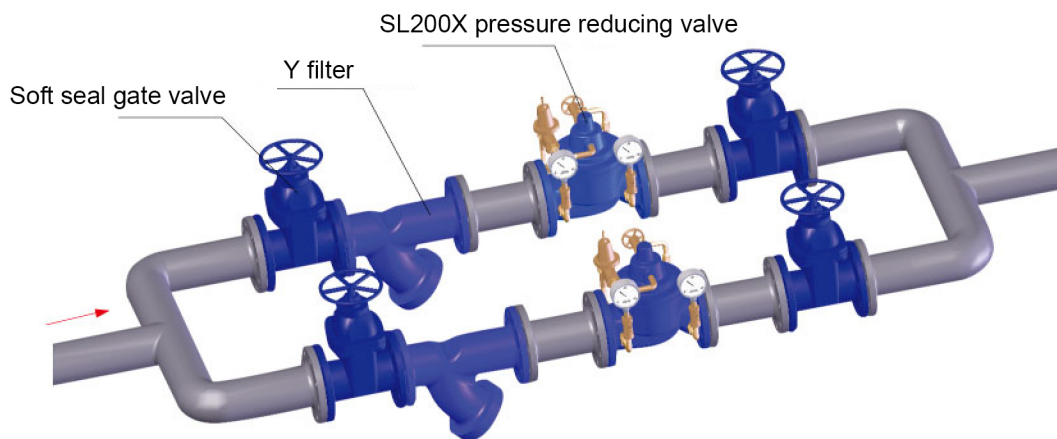

The SL200X pressure reducing valve is an intelligent valve that uses the energy of the medium to regulate and control the pressure of the line. The 200X pressure reducing valve is used for domestic water supply, fire water supply and other industrial water supply systems. By adjusting the pressure reducing pilot valve, the outlet pressure of the main valve can be adjusted. The outlet pressure is not changed by the inlet pressure and the change of the inlet flow. The outlet pressure is safely and reliably maintained at the set value, and the set value can be adjusted as needed to achieve the purpose of decompression. The valve has precise decompression, stable performance, safety and reliability, and convenient installation and adjustment.

External Structure

1. Float ball pilot valve 2. ball valve 3. Needle valve
